

The Kiosk is designed specifically for facilities that have high visitor volume and the desire to speed up the visitor entry process with minimal intervention by personnel. The kiosk is most often coupled with a **FAST-PASS®** Registration station where information is verified and a pass is printed. It can either a) be configured for high volume pre-registration used in conjunction with registration for i.d. verification or, b) be configured for return visitors. Generally, kiosks will be placed in the lobby to pre-register visitors before they enter an access point. The Kiosk is a fully integrated unit that offers both stand alone and enhancement capabilities to the system.
